

Evolving AI Governance with Generative AI

In this talk, we explore the dynamic relationship between artificial intelligence (AI) governance and the transformative impact of generative AI technologies by delving into the challenges and opportunities emerging from the integration of generative AI, a subset of AI characterized by its ability to create novel content, into existing governance frameworks. The rising potential of generative AI, particularly the Large Language Models, necessitates a paradigm shift in organisational processes and practices. Hence, the conventional governance models must adapt to the unique challenges posed by generative AI, given its capacity to autonomously generate content, potentially blurring lines between human and machine authorship. We highlight the role of regulatory bodies, industry standards, and interdisciplinary collaboration in shaping a responsible and adaptive governance ecosystem. We further underscore the need for proactive measures to address emerging risks associated with generative AI, such as deepfakes, toxicity, and hallucination. Lastly, we discuss the potential benefits of leveraging generative AI to enhance governance processes, from automating compliance checks to optimizing decision-making mechanisms. In conclusion, this talk posits that the synergy between governance and generative AI is pivotal for harnessing the transformative potential of AI while safeguarding against unintended consequences.

February 09, 2024

6:00 pm - 7:30 pm

(UTC+5:30)

Webinar on Teams &

Physical Event at
Royal College Skills
Center, Colombo 07.
